

BlockWatch delivers enhanced security services for cloud computing deployments. Out-of-the-box monitoring and reporting regains the high ground for your security team.

Compute cloud

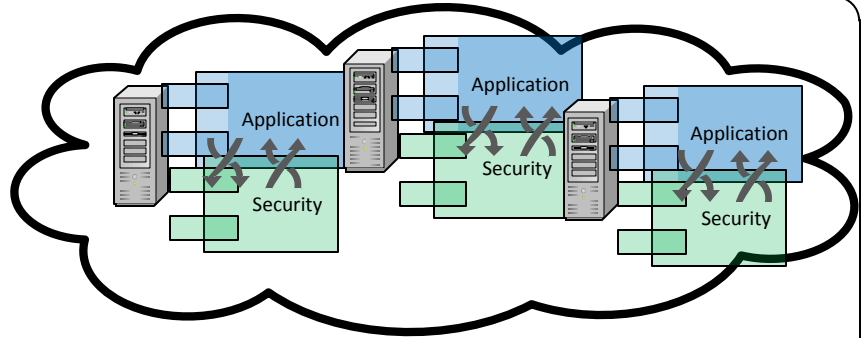

Cloud computing leverages economy of scale to enable more users to access the same physical amount of servers than previously possible.

Cloud with traditional security.

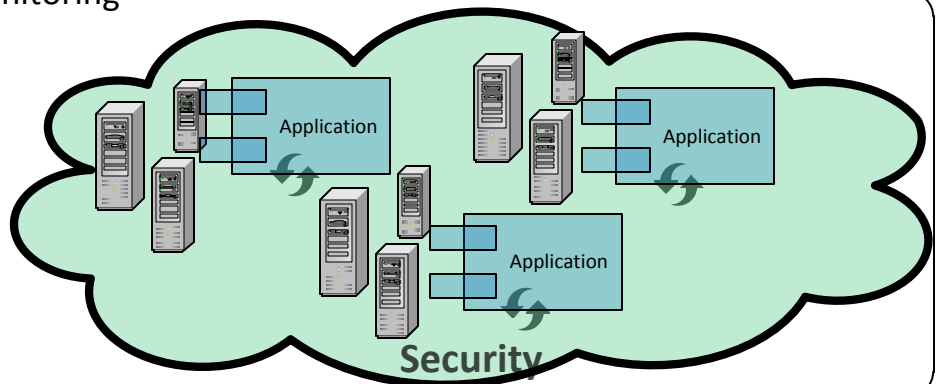

Traditional or legacy security systems are unable to "see" beyond a server instance, limiting their effectiveness to existing "cat & mouse games".

Leads to bloating and redundant waste of resources.

BlockWatch enabled security monitoring

BlockWatch is an *out-of-the-box* cloud technology, delivering tamper resistance operations and new capabilities like **code** with **data** monitoring.

Key BlockWatch Benefits

- **Out-of-the-box** cloud based monitoring
Memory based technologies
- Whitelist driven
No guessing, monitor code and data breach scenarios effectively
- Identifies partial (block) matches
Previous white lists required full files for making GOOD/BAD decision
- Expandable with scripts
Examples for monitoring networks and physical servers (not just cloud) too!
